CHEM1001	2012-J-11	June 2012	22/01(a)
• Rank the following compounds in order of increasing boiling point? Justify your answer.			Marks 3
	CH <sub>3</sub> CH <sub>2</sub> OCH <sub>2</sub> CH <sub>3</sub> , CH <sub>3</sub> OH, CH <sub>4</sub> , CH <sub>3</sub> CH <sub>3</sub> ,	CH <sub>3</sub> CH <sub>2</sub> OH	
CH <sub>4</sub> < C	H <sub>3</sub> CH <sub>3</sub> < CH <sub>3</sub> CH <sub>2</sub> OCH <sub>2</sub> CH <sub>3</sub> < CH <sub>3</sub> OH < CH	I <sub>3</sub> CH <sub>2</sub> OH	
Only weak dispersion forces act in CH <sub>4</sub> and CH <sub>3</sub> CH <sub>3</sub> . The bigger molecule has more interactions and hence the higher b.p. CH <sub>3</sub> CH <sub>2</sub> OCH <sub>2</sub> CH <sub>3</sub> is a bigger molecule than CH <sub>4</sub> and CH <sub>3</sub> CH <sub>3</sub> , so has more dispersion forces. It also has dipole-dipole forces due to the polarised C-O bonds.			
CH <sub>3</sub> OH and CH <sub>3</sub> CH <sub>2</sub> OH have hydrogen bonds due to the very electronegative O atom bonded to the H atom. These H-bonds are much stronger than the dispersion and dipole-dipole forces in the other compounds and hence these two compounds have the highest boiling points. CH <sub>3</sub> CH <sub>2</sub> OH has more dispersion forces than CH <sub>3</sub> OH, so it has the highest boiling point.			
<ul> <li>Melting po Explain th</li> </ul>	oints of the hydrogen halides increase in the order H is trend.	ICl < HBr < HF < HI.	2
<ul> <li>There are two competing intermolecular forces at play:</li> <li>Dipole-dipole forces increase as the halogen becomes more electronegative (I &lt; Br &lt; Cl &lt; F).</li> <li>Dispersion forces are dependent on the polarisability of the atoms and increase with the size of the halogen.</li> <li>Dispersion force dominate in HCl, HBr and HI and determines the order of their melting points.</li> </ul>			
mennig p	011115.		

The dipole-dipole force in HF is so strong (due to the very small and very electronegative F atom) that it is given a special name - a hydrogen bond. This causes HF to have an anomalously high melting point, which just happens to lie between that of HBr and HI.
