• The N ₂ ⁺ ion plays a role in the colourful display of the Northern Lights (the <i>Aurora Borealis</i>).		Marks 5
The molecular orbital energy level diagra provided shows the energies of the orbital for the valence electrons in the N_2^+ ion. Indicate on this diagram the ground state electronic configuration of N_2^+ using the arrow notation for electron spins.	$\begin{bmatrix} & & & \\ & & & & \\ & & & \\ & & & & & \\ & & & & \\ & & & & & \\ & & & & \\ & & & $	
	π	
	σ	
Calculate the bond order of N_2^+ .		
Indicate the lowest energy electron excitation in this ion by identifying the initial and final states of the electron undergoing the excitation.		-
The line at 3914 Å (391.4 nm) in the emission spectrum of the <i>Aurora Borealis</i> is due to N_2^+ returning to its ground state. Calculate the energy gap (in eV) between the molecular orbitals involved in this transition.		
	Answer:
