CHEM1902/1904 2007-N-4 November 2007

• Alfred Werner, one of the founders of the field of coordination chemistry, made extensive studies of the metal complex [PtCl ₂ (NH ₃) ₂]. He showed that it existed in two isomeric forms and used this information to predict that the compound had a square-planar molecular geometry. What other molecular geometry would need to be considered for such a complex and on what basis did Werner reject this alternative geometry?	Marks 6
Draw and name the two isomers.	
Why does platinum(II) form square-planar complexes?	
Which one of the isomers is biologically active? What is its activity? Describe two features of the complex that play important roles in this biological activity.
