

Topics in the June 2013 Exam Paper for CHEM1101

Click on the links for resources on each topic.

2013-J-2:

- [Ionic Bonding](#)

2013-J-3:

- [Types of Intermolecular Forces](#)
- [First and Second Law of Thermodynamics](#)

2013-J-4:

- [Filling Energy Levels in Atoms Larger than Hydrogen](#)
- [Nuclear and Radiation Chemistry](#)

2013-J-5:

- [Periodic Table and the Periodic Trends](#)
- [Wave Theory of Electrons and Resulting Atomic Energy Levels](#)

2013-J-6:

- [Bonding - MO theory \(larger molecules\)](#)

2013-J-7:

- [Lewis Structures](#)
- [VSEPR](#)

2013-J-8:

- [Thermochemistry](#)
- [Nitrogen Chemistry and Compounds](#)
- [Nitrogen in the Atmosphere](#)

2013-J-9:

- [Chemical Equilibrium](#)

2013-J-10:

- [First and Second Law of Thermodynamics](#)
- [Gas Laws](#)
- [Nitrogen Chemistry and Compounds](#)

2013-J-11:

- [Equilibrium and Thermochemistry in Industrial Processes](#)

2013-J-12:

- [Electrolytic Cells](#)
- [Electrochemistry](#)
- [Batteries and Corrosion](#)

2013-J-13:

- [Electrochemistry](#)
- [Batteries and Corrosion](#)

THE UNIVERSITY OF SYDNEY

CHEMISTRY 1A - CHEM1101**CONFIDENTIAL**FIRST SEMESTER EXAMINATION

JUNE 2013

TIME ALLOWED: THREE HOURS

GIVE THE FOLLOWING INFORMATION IN BLOCK LETTERS

FAMILY NAME		SID NUMBER	
OTHER NAMES		TABLE NUMBER	

INSTRUCTIONS TO CANDIDATES

- All questions are to be attempted. There are 21 pages of examinable material.
- Complete the written section of the examination paper in **INK**.
- Read each question carefully. Report the appropriate answer and show all relevant working in the space provided.
- The total score for this paper is 100. The possible score per page is shown in the adjacent tables.
- Each new short answer question begins with a •.
- Only non-programmable, University-approved calculators may be used.
- Students are warned that credit may not be given, even for a correct answer, where there is insufficient evidence of the working required to obtain the solution.
- Numerical values required for any question, standard electrode reduction potentials, a Periodic Table and some useful formulas may be found on the separate data sheets.
- Pages 17 and 24 are for rough working only.

OFFICIAL USE ONLY**Multiple choice section**

<ul style="list-style-type: none">• What is an ionic bond?	Marks 6
<p>Why does ionic bonding favour the formation of macroscopic crystals rather than molecules?</p>	
<p>What information do you need to estimate the relative lattice energies of two chemically different salts?</p>	

<ul style="list-style-type: none">• Intermolecular forces are responsible for the physical properties of many compounds. What are dispersion forces?	Marks 3
<p>The boiling points of F₂, Cl₂ and Br₂ are 85, 239 and 338 K, respectively. Where would you expect the boiling point of I₂? Give reasons.</p>	
<ul style="list-style-type: none">• The Second Law states that all observable processes must involve a net increase in entropy. When liquid water freezes into ice at 0 °C, the entropy of the water decreases. Explain how this is consistent with the Second Law.	2

<ul style="list-style-type: none">Write down the ground state electron configurations for the following species. Na is given as an example.		Marks 4
Na	[Ne] $3s^1$	
K		
As		
Sr		
C^+		
Name the elements described by the following configurations.		
[Kr] $5s^2 4d^6$		
[Xe] $6s^2 5d^1 4f^{11}$		
<ul style="list-style-type: none">Radioactivity may have damaging effects on humans but can also be used for medical imaging to potentially save lives. Which of alpha and gamma radiation is better suited for medical imaging? Give reasons.		4
Given nuclides with half-lives of minutes, hours or years, which would be best used for medical imaging? Explain.		

- The Periodic Table as arranged by Mendeleev allows us to make predictions about the behaviours of elements based on those around them. Briefly describe why the Periodic Table works.

Marks
5

Silicon and tin have the same structure as diamond. Use the information in the following table to predict the density of tin.

Element	Atomic Mass	Density (g cm^{-3})	Bond length (pm)
Si	28	2.329	233
Sn	118		280

Answer:

- Oxygen exists in the troposphere as a diatomic molecule.

Marks
8

How many valence electrons in the O₂ molecule?

The molecular orbital energy levels for O₂ are shown below. On the left-hand diagram, fill in the **valence** electrons for oxygen, O₂, in the ground state.

- (a) What is the bond order for O₂?
- (b) Clearly label a bonding orbital and an anti-bonding orbital on the left-hand diagram.
- (c) Clearly label the HOMO of O₂ on the left-hand diagram.
- (d) On the right-hand diagram, indicate the lowest energy electronic configuration for O₂ which has no unpaired electrons.

The blue colour of liquid O₂ arises from an electronic transition whereby one 635 nm photon excites two molecules to the state indicated by the configuration in (d) *at the same time*. What wavelength photon would be emitted by one molecule returning from this state to the ground state?

Answer:

Suggest a heteronuclear diatomic species, isoelectronic with O₂, that might be expected to have similar spectroscopic behaviour.

• Complete the following table for the molecules SF₆ and SF₄.

Marks
6

Molecule	Total number of valence electrons	Lewis structure	Shape of molecule
SF ₆			
SF ₄			

Sulfur hexafluoride (SF₆) is quite inert, whilst sulfur tetrafluoride (SF₄) is highly reactive. Suggest a reason for the difference in reactivity between SF₆ and SF₄.

--

<ul style="list-style-type: none">1.00 L of water is heated to 95 °C and then solid copper, initially at 25 °C, is immersed in it. What mass of copper was added if the final temperature of the water was 84 °C? Show all working. <p>Data: Specific heat capacity of Cu(s) is 0.39 J g⁻¹ K⁻¹. Specific heat capacity of H₂O(l) is 4.184 J g⁻¹ K⁻¹. The density of water is 1.0 g mL⁻¹.</p>	Marks 3
<div style="border: 1px solid black; height: 280px; width: 100%;"></div> <div style="border: 1px solid black; width: fit-content; margin-left: auto; margin-right: auto; padding: 5px;">Answer:</div>	
<ul style="list-style-type: none">Atmospheric nitrogen is converted into ammonia or various oxides by both natural processes and those associated with human activity. Identify one process (either natural or due to human activity) that results in the conversion of N₂ to either NH₃ or an oxide of nitrogen and identify the nitrogen compound produced in that process.	2
<div style="border: 1px solid black; height: 230px; width: 100%;"></div>	

- Consider the following reaction.

An equilibrium mixture in a 1.00 L container is found to contain $[\text{N}_2\text{O}_4] = 1.00 \text{ M}$ and $[\text{NO}_2] = 0.46 \text{ M}$. The vessel is then compressed to half its original volume while the temperature is kept constant. Calculate the concentration $[\text{N}_2\text{O}_4]$ when the compressed system has come to equilibrium. Show all working.

Marks**4**

Answer:

<p>• Use the standard heats of formation provided to calculate the molar heat of combustion of liquid methanol, CH₃OH, in oxygen to produce CO₂ and water. Your answer must include a balanced chemical equation for this reaction. Show all working.</p> <p>Data:</p> <table border="1" data-bbox="316 376 983 481"><thead><tr><th>Compound</th><th>H₂O(l)</th><th>CH₃OH(l)</th><th>CO₂(g)</th></tr></thead><tbody><tr><td>$\Delta_f H^\circ / \text{kJ mol}^{-1}$</td><td>-285.9</td><td>-238.6</td><td>-393.5</td></tr></tbody></table> <div data-bbox="180 481 1284 896" style="border: 1px solid black; height: 185px;"></div> <p style="text-align: right; border: 1px solid black; padding: 2px;">Answer:</p>	Compound	H ₂ O(l)	CH ₃ OH(l)	CO ₂ (g)	$\Delta_f H^\circ / \text{kJ mol}^{-1}$	-285.9	-238.6	-393.5	Marks 2
Compound	H ₂ O(l)	CH ₃ OH(l)	CO ₂ (g)						
$\Delta_f H^\circ / \text{kJ mol}^{-1}$	-285.9	-238.6	-393.5						
<p>• Calculate the volume change when 10.0 g of solid trinitrotoluene C₇H₅N₃O₆(s) explosively decomposes via the following process at 2000. °C and 1.0 atm.</p> $2\text{C}_7\text{H}_5\text{N}_3\text{O}_6(\text{s}) \rightarrow 12\text{CO}(\text{g}) + 5\text{H}_2(\text{g}) + 3\text{N}_2(\text{g}) + 2\text{C}(\text{s})$ <p>Assume all gases behave as ideal gases and neglect the volume of any solid phases. Show all working.</p> <div data-bbox="180 1198 1284 1612" style="border: 1px solid black; height: 185px;"></div> <p style="text-align: right; border: 1px solid black; padding: 2px;">Answer:</p>	3								

- The diagram below represents the Gibbs free energy change associated with the formation of four different oxides.

Marks
4

Using the free energy data above, write down the equation and indicate with an arrow the direction of the expected spontaneous reaction under the following conditions. If no reaction occurs, write “no reaction”.

CO and Sn are mixed at 400 $^{\circ}\text{C}$

Al and ZnO are mixed at 400 $^{\circ}\text{C}$

CO and Sn are mixed at 900 $^{\circ}\text{C}$

Which oxide has the smallest (least negative) enthalpy of formation?

<ul style="list-style-type: none">How many hours does it take to form 10.0 L of O_2 measured at 99.8 kPa and 28 °C from water if a current of 1.3 A passes through the electrolysis cell?	Marks 3
<div style="border: 1px solid black; height: 150px; width: 100%;"></div> <div style="border: 1px solid black; width: 30%; margin-left: auto; padding: 5px;">Answer:</div>	
<ul style="list-style-type: none">In concentration cells no net chemical conversion occurs, however a measurable voltage is present between the two half-cells. Explain how the voltage is produced.	2
<div style="border: 1px solid black; height: 150px; width: 100%;"></div>	
<ul style="list-style-type: none">Is H_2 a stronger reducing agent under acidic or basic conditions? Give reasons for your answer.	2
<div style="border: 1px solid black; height: 150px; width: 100%;"></div>	

	Marks
<ul style="list-style-type: none">A galvanic cell utilises the following redox reaction. $\text{NH}_4^+(\text{aq}) + 8\text{Ce}^{4+}(\text{aq}) + 3\text{H}_2\text{O}(\text{l}) \rightarrow \text{NO}_3^-(\text{aq}) + 8\text{Ce}^{3+}(\text{aq}) + 10\text{H}^+(\text{aq})$	7
What species is the reducing agent in this reaction?	
How many electrons are transferred in the redox reaction?	
Calculate the standard cell potential, E°_{cell} , for this electrochemical cell.	
Answer:	
Calculate ΔG° for the redox reaction at 25 °C.	
Answer:	
What is the effect on the E_{cell} of decreasing the concentration of $\text{NO}_3^-(\text{aq})$ in the anode compartment?	
Calculate the cell potential, E_{cell} , when $[\text{NH}_4^+] = 0.35 \text{ M}$, $[\text{Ce}^{4+}] = 0.25 \text{ M}$, $[\text{NO}_3^-] = 5.0 \times 10^{-2} \text{ M}$, $[\text{Ce}^{3+}] = 6.0 \times 10^{-2} \text{ M}$, and the pH is 2.0.	
Answer:	

CHEM1101 - CHEMISTRY 1A

DATA SHEET

*Physical constants*Avogadro constant, $N_A = 6.022 \times 10^{23} \text{ mol}^{-1}$ Faraday constant, $F = 96485 \text{ C mol}^{-1}$ Planck constant, $h = 6.626 \times 10^{-34} \text{ J s}$ Speed of light in vacuum, $c = 2.998 \times 10^8 \text{ m s}^{-1}$ Rydberg constant, $E_R = 2.18 \times 10^{-18} \text{ J}$ Boltzmann constant, $k_B = 1.381 \times 10^{-23} \text{ J K}^{-1}$ Permittivity of a vacuum, $\epsilon_0 = 8.854 \times 10^{-12} \text{ C}^2 \text{ J}^{-1} \text{ m}^{-1}$ Gas constant, $R = 8.314 \text{ J K}^{-1} \text{ mol}^{-1}$
