• Explain why compounds of *d*-block elements are frequently paramagnetic. Use examples in your answer.	**2**
• Provide a systematic name for *cis*-$[Co(en)_2Cl_2]Cl$. Is this complex chiral? Explain your reasoning by drawing the structure of the complex. en = $NH_2CH_2CH_2NH_2$ = ethane-1,2-diamine = ethylenediamine	**3**

Marks 7

- Solution A consists of a 0.020 M aqueous solution of aspirin (acetylsalicylic acid, $C_9H_8O_4$) at 25 °C. Calculate the pH of Solution A. The pK_a of aspirin is 3.52.

Answer:

At 25 °C, 1.00 L of Solution B consists of 4.04 g of sodium acetylsalicylate ($NaC_9H_7O_4$) dissolved in water. Calculate the pH of Solution B.

Answer:

Solution B (200.0 mL) is mixed with Solution A (400.0 mL) and water (200.0 mL) to give Solution C. Calculate the pH of Solution C after equilibration at 25 °C.

Answer:

If you wanted to adjust the pH of Solution C to be exactly equal to 3.00, which component in the mixture would you need to increase in concentration?

Marks

- Write a balanced chemical equation representing the dissolution of $FeCO_3$ in water at pH 7. **4**

Ignoring any hydrolysis of the ions, calculate the solubility (in g L^{-1}) of $FeCO_3$ in water at pH 7. The solubility product constant, K_{sp}, for $FeCO_3$ is 2.1×10^{-11}.

Answer:

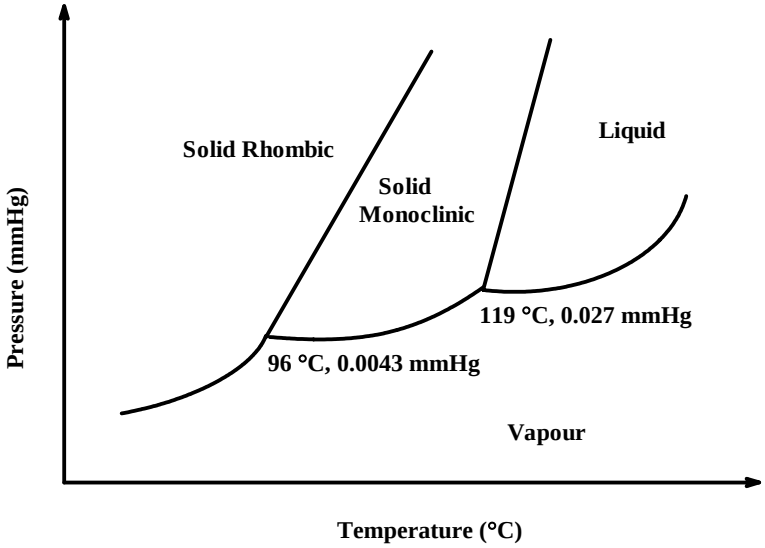
- The concentration of iron in the ocean is one of the primary factors limiting the growth rates of some basic life forms. The pH of the oceans before the Industrial Revolution was around 8.22. What was the maximum concentration of $Fe^{3+}(aq)$ in the ocean at this pH? The K_{sp} of $Fe(OH)_3$ is 1×10^{-39}. **4**

Answer:

Industrialisation has led to an increase in atmospheric CO_2. What effect has this had on the amount of $Fe^{3+}(aq)$ in sea water?

Marks 6

- Solid sulfur can exist in both rhombic and monoclinic forms. A portion of the phase diagram for sulfur is reproduced schematically below.



How many triple points are there in the phase diagram?

What phases are in equilibrium at each of the triple points?

What phase is stable at room temperature and 760 mmHg pressure?

Can monoclinic sulfur exist in equilibrium with sulfur vapour at 1.0 atm pressure?

Which solid form of sulfur is more dense? Explain your reasoning.

Describe the phase changes that occur when sulfur at 0.01 mmHg is slowly warmed from 90 °C to 130 °C.

- An alloy is formed by combining elements A and B. The alloy has a face-centred cubic structure, with atoms of A at the corners and atoms of B in the faces. What is the formula of the alloy? Explain your reasoning.
