

## CHEM1405 - CHEMISTRY (VETERINARY SCIENCE)

### FIRST SEMESTER EXAMINATION

**CONFIDENTIAL**

**JUNE 2005**

**TIME ALLOWED: THREE HOURS**

GIVE THE FOLLOWING INFORMATION IN BLOCK LETTERS

<b>FAMILY NAME</b>		<b>SID NUMBER</b>	
<b>OTHER NAMES</b>		<b>TABLE NUMBER</b>	

### INSTRUCTIONS TO CANDIDATES

- All questions are to be attempted. There are 20 pages of examinable material.
- Complete the examination paper in **INK**.
- Read each question carefully. Report the appropriate answer and show all relevant working in the space provided.
- The total score for this paper is 100. The possible score per page is shown in the adjacent tables.
- Each new short answer question begins with a •.
- Electronic calculators, including programmable calculators, may be used. Students are warned, however, that credit may not be given, even for a correct answer, where there is insufficient evidence of the working required to obtain the solution. Logarithms may also be used.
- Numerical values required for any question as well as a Periodic Table are printed on a separate data sheet.
- Pages 17, 22 & 24 are for rough work only.

### OFFICIAL USE ONLY

#### Multiple choice section

	Marks	
Pages	Max	Gained

**Marks**  
**6**

- Glycine,  $\text{NH}_2\text{CH}_2\text{COOH}$ , the simplest of all naturally occurring amino acids, has a melting point of  $292\text{ }^\circ\text{C}$ . The  $\text{p}K_a$  of the acid group is 2.35 and the  $\text{p}K_a$  associated with the amino group is 9.78. Draw a structure that indicates the charges on the molecule at the physiological pH of 7.4.

Use your structure to illustrate the concept of resonance.

Describe the hybridisation of the two carbon atoms and the nitrogen atom in glycine and the geometry of the atoms surrounding these three atoms.

Glycine has an unusually high melting point for a small molecule. Suggest a reason for this.

**Marks**  
**3**

- Quinine is a natural product that has anti-malarial properties. It was originally extracted for therapeutic use from the bark of the cinchona tree, but is now synthesised by the pharmaceutical industry. Quinine is not very soluble in water and is generally administered as the more soluble hydrochloride salt ( $C_{20}H_{24}N_2O_2 \cdot HCl$ ). The  $pK_a$  of this salt is 4.32. What is the pH of a 0.053 M solution of quinine hydrochloride?

Answer:

- Use chemical equations to illustrate how  $HPO_4^{2-}/H_2PO_4^-$  can act as a buffer.

2

- Ammonia ( $NH_3$ ) has a boiling point of  $-33\text{ }^\circ C$  and phosphine ( $PH_3$ ) has a boiling point of  $-83\text{ }^\circ C$ . Explain the difference in these boiling points in terms of the intermolecular forces present.

2

**Marks**  
**4**

- A saline solution used for intravenous injections contains 900 mg of sodium chloride in 100 mL. What is the concentration of this sodium chloride solution?

Answer:

What is the osmotic pressure of this solution at 37 °C?

Answer:

Why is it better to use a saline solution rather than pure water when administering drugs intravenously?

**2**

- Write the ground state electron configuration of the  $\text{Ca}^{2+}$  cation.

List the quantum numbers ( $n, l, m_l, m_s$ ) that describe any one of the electrons in the ground state  $\text{Ca}^{2+}$  cation.

**Marks**  
**5**

- For the reaction  $2\text{SO}_2(\text{g}) + \text{O}_2(\text{g}) \rightleftharpoons 2\text{SO}_3(\text{g})$  at  $25\text{ }^\circ\text{C}$

$$\Delta H^\circ = -198.4 \text{ kJ mol}^{-1} \text{ and } \Delta S^\circ = -187.9 \text{ J K}^{-1} \text{ mol}^{-1}$$

Show that this reaction is spontaneous in the forward direction at  $25\text{ }^\circ\text{C}$ .

If the volume of the reaction system is increased at  $25\text{ }^\circ\text{C}$ , in which direction will the equilibrium move?

Calculate the value of the equilibrium constant,  $K_p$ , at  $25\text{ }^\circ\text{C}$ .

$K_p =$

Assuming  $\Delta H^\circ$  and  $\Delta S^\circ$  are independent of temperature, in which temperature range is the reaction non-spontaneous?

Answer:

- The atmosphere contains 21% oxygen. Given an atmospheric pressure of 755 mmHg, what is the partial pressure of oxygen (in atm) under these conditions?

**Marks**  
**2**

Answer:

- Sevoflurane is an anaesthetic with a half-life in the brain of 2.3 minutes. How long does it take for the concentration of sevoflurane in brain tissue to drop from 0.025 mM to one hundredth of this value?

**3**

Answer:

**THE REMAINDER OF THIS PAGE IS FOR ROUGH WORKING ONLY**

**Marks**  
**10**

- How would you distinguish between the following pairs of molecules by means of a simple chemical test? In each case, indicate what reagent would be added and any physical change observed. Write an equation for any reaction that occurs. Specify if no reaction occurs by writing "N.R."

- The constitutional formula of nicotinamide adenine dinucleotide, NADH, is given below.

Marks  
4

Give the structure of  $\text{NAD}^+$ . (You may use "R" to abbreviate the adenine dinucleotide portion of the molecule.)

Give the structure of adenosine, a nucleoside containing the nucleic base adenine.

**THIS QUESTION IS CONTINUED ON THE NEXT PAGE.**

Give the structure of a tautomer of adenine.

**Marks**  
**4**

Give the structure of the open chain form of D-ribose.

Complete the following by indicating  $\text{NAD}^+$  or  $\text{NADH}$  for the forward and reverse reactions.

**THE REMAINDER OF THIS PAGE IS FOR ROUGH WORKING ONLY**

**Marks**  
**4**

- Name the following compounds. Be careful to include stereochemical descriptors where appropriate.

**4**

- Give the constitutional formula for a naturally occurring tripeptide, Lys-Glu-Ala. Side-chains: Lys =  $-(\text{CH}_2)_4\text{NH}_2$ ; Glu =  $-\text{CH}_2\text{CH}_2\text{COOH}$ ; Ala =  $-\text{CH}_3$ .

--

The pI for Lys is 9.7 and its  $pK_a$  values are 2.18 ( $\alpha\text{-COOH}$ ), 8.95 ( $\alpha\text{-NH}_3^{\oplus}$ ) and 10.53 ( $-(\text{CH}_2)_4\text{NH}_3^{\oplus}$ ). Use a Fischer projection to show the predominant species present in an aqueous solution of Lys at pH 9.7.

--
