Marks 10

- Draw the Lewis structure of the acetate ion (CH_3COO^-) showing all appropriate resonance structures.

Indicate the hybridisation, molecular geometry and approximate bond angle about each of the carbon atoms in the acetate ion.

	$-CH_3$	$-COO^-$
Hybridisation of C		
Molecular geometry about C		
Approximate bond angles about C		

The actual structure of the acetate ion is a weighted combination of all resonance structures. Sketch the σ-bond framework of the acetate ion and indicate the *p*-orbitals that are involved in the π-bonding of the acetate ion.

How many electrons are involved with the π-bonding?

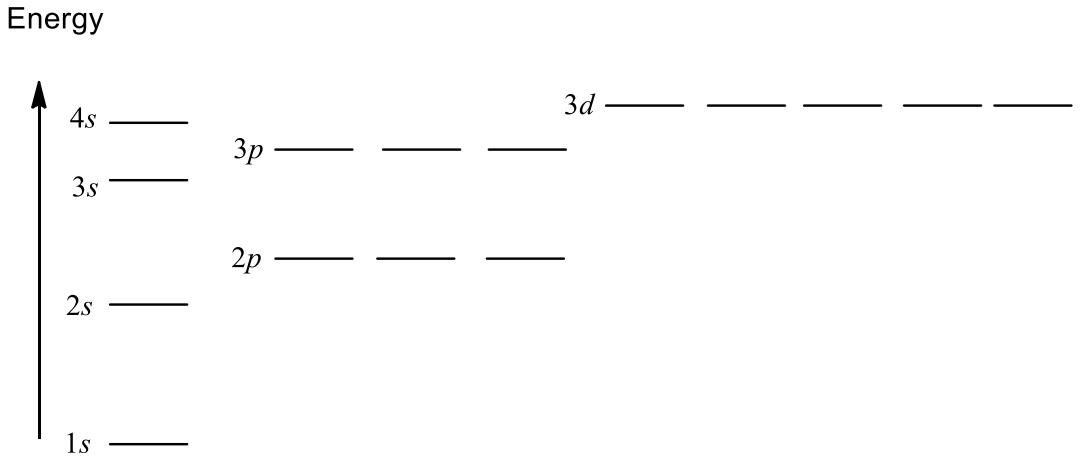
What is the hybridisation of the oxygen atoms in the acetate ion?

Marks 5

- The yellow light emitted from an excited sodium atom has a wavelength of 590 nm. What is the energy of one photon of this light and one mole of photons? Specify appropriate units with your answers.

Energy	of one photon:	of 1 mol of photons:

The yellow light is associated with the longest wavelength transition as the atom returns to the ground state electron configuration. Fill in the following energy level diagram for sodium and indicate the transition associated with the emission of yellow light.



A quantum mechanical model of an atom can explain the emission spectrum of sodium, but the Bohr model of the atom cannot. Why?

Marks 11

 **Name:**			2 M HCl	

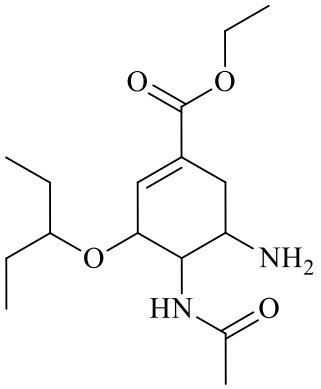
Marks 6

- Oseltamivir, marketed under the trade name Tamiflu, is an antiviral drug, which may slow the spread of influenza (flu) virus between cells in the body by stopping the virus from chemically cutting ties with its host cell.

Tamiflu



Give the molecular formula of Tamiflu.

List the functional groups present in Tamiflu.

How many stereogenic centres are there in Tamiflu?

How many possible stereoisomers can exist for Tamiflu?
