- Copper oxide is used as a photovoltaic material in solar cells and it crystallizes with the structure shown below. The large white spheres represent the oxygen atoms and the smaller black spheres represent copper atoms.

How many unit cells are represented in the above diagram? Explain your answer.

From the solid-state structure shown above, determine the empirical formula for copper oxide.

What is the oxidation state of copper in this compound?

Use the box notation to predict whether the copper ions are paramagnetic.
$\square$
Silver oxide is another Group 11 metal oxide and its solid-state structure is identical to that of copper oxide even though the ionic radius for the copper ion (118 pm) is smaller than that of the silver ion ( 139 pm ). Account for this observation.

- $\mathrm{K}_{2}\left[\mathrm{Re}_{2} \mathrm{Cl}_{8}\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}$ is an historically important example of a metal-metal bonded complex. Name the complex by using standard IUPAC nomenclature.

What is the oxidation state of Re in this complex?
How many $d$-electrons are on each Re atom in this complex?
$\mathrm{K}_{2}\left[\mathrm{Re}_{2} \mathrm{Cl}_{8}\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}$ possesses an extremely short $\mathrm{Re}-\mathrm{Re}$ bond ( 224 pm ), much shorter than the bonding distance between Re atoms in Re metal (274 pm)! Propose a reasonable explanation for the very short Re-Re bond length in the complex by adding $d$-electrons into the (partial) MO scheme shown below. Determine the bond order for the metal-metal bond and draw a structure for the complex.

Reduction of the Re complex by one electron gives rise to a paramagnetic species in which the Re-Re distance increases significantly. Propose a reasonable hypothesis for the bond-lengthening phenomenon.

- Boric acid, $\mathrm{B}(\mathrm{OH})_{3}$, is a weak acid $\left(\mathrm{p} K_{\mathrm{a}}=9.24\right)$ that is used as a mild antiseptic and eye wash. Unusually, the Lewis acidity of the compound accounts for its Brønsted acidity. By using an appropriate chemical equation, show how this compound acts as a Brønsted acid in aqueous solution.

Solution A consists of a 0.40 M aqueous solution of boric acid at $25^{\circ} \mathrm{C}$. Calculate the pH of Solution A.

$$
\mathrm{pH}=
$$

At $25^{\circ} \mathrm{C}, 1.00 \mathrm{~L}$ of Solution B consists of 101.8 g of $\mathrm{NaB}(\mathrm{OH})_{4}$ dissolved in water. Calculate the pH of Solution B.
$\square$
Using both Solutions A and B, calculate the volumes (mL) required to prepare a 1.0 L solution with a $\mathrm{pH}=8.00$.

- What is the solubility of $\mathrm{Cu}(\mathrm{OH})_{2}$ in $\mathrm{mol} \mathrm{L}^{-1}$ ? $K_{\text {sp }}\left(\mathrm{Cu}(\mathrm{OH})_{2}\right)$ is $1.6 \times 10^{-19}$ at $25^{\circ} \mathrm{C}$.

The overall formation constant for $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$ is $1.0 \times 10^{13}$. Write the equation for the reaction of $\mathrm{Cu}^{2+}$ ions with excess ammonia solution.

Calculate the value of the equilibrium constant for the following reaction.

$$
\mathrm{Cu}(\mathrm{OH})_{2}(\mathrm{~s})+4 \mathrm{NH}_{3}(\mathrm{aq}) \rightleftharpoons\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}(\mathrm{aq})+2 \mathrm{OH}^{-}(\mathrm{aq})
$$

$\square$

- The diagram below shows the phase diagram of sulfur. Note that 'rhombic' and

Determine the number of triple points for sulfur and indicate which species are present at each of the triple points.
$\square$
Which crystalline form of sulfur is predicted to be more dense? Briefly explain your answer.
"Plastic" sulfur is a tough elastic substance that is formed when molten sulfur (m.p. $=115.2^{\circ} \mathrm{C}$ ) is poured into cold water. On standing, it slowly crystallizes. Predict which crystalline form is formed at room temperature and pressure.
Also, explain why "plastic" sulfur is not shown on the above phase diagram.

- Addition of HBr to the isomer of 2-pentene shown below gives 3 isomeric products,

A, B and C, in an approximate ratio of 50:25:25 respectively.

$\qquad$ $\mathbf{A}+\mathbf{B}+\mathbf{C}$

Draw the three products $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$.

| A | B | C |
| :--- | :--- | :--- |

Explain the ratio of products observed.

What is the isomeric relationship between $\mathbf{A}$ and $\mathbf{B}$ ?
What is the isomeric relationship between $\mathbf{B}$ and $\mathbf{C}$ ?
Assign the stereochemistry of the starting material isomer. Show your working.
$\square$
Draw the other configurational isomer of 2-pentene and assign its stereochemistry.

What product(s) would you expect from the addition of HBr to this stereoisomer, and in what ratio?

- Consider the amine $\mathbf{D}$, imine $\mathbf{E}$ and nitrile $\mathbf{F}$ shown below. Draw any lone pairs of electrons that are required to complete the structures.

THE REMAINDER OF THIS PAGE IS FOR ROUGH WORKING ONLY.

- Consider the following reaction sequences beginning with the secondary alcohol, G.

Suggest structures for compounds $\mathbf{H}-\mathbf{M}$ in the reaction sequences above.

| $\mathbf{H}$ | $\mathbf{I}$ | $\mathbf{J}$ |
| :--- | :--- | :--- |
| $\mathbf{K}$ | $\mathbf{L}$ | $\mathbf{M}$ |

What approximate ratio $\mathbf{H}$ : I do you expect? Why?

What type of reaction is occurring in Step i?
What type of reaction is occurring in Step ii?
What type of reaction is occurring in Step iii?
What type of reaction is occurring in Step iv? $\square$

What is the systematic name for $\mathbf{G}$ ?

How many configurational stereoisomers of $\mathbf{G}$ are there?
Assign the absolute configuration of stereoisomer $\mathbf{G}_{\mathbf{1}}$ below. Show your working.

$\mathrm{G}_{1}$
Draw $\mathbf{G}_{\mathbf{2}}$ (the enantiomer of $\mathbf{G}_{\mathbf{1}}$ ) and $\mathbf{G}_{\mathbf{3}}$ (a diastereomer of $\mathbf{G}_{\mathbf{1}}$ )

| $\mathbf{G}_{2}$ (enantiomer of $\mathbf{G}_{1}$ ) | $\mathbf{G}_{3}$ (diastereomer of $\mathbf{G}_{1}$ ) |
| :--- | :--- |
|  |  |
|  |  |

THE REMAINDER OF THIS PAGE IS FOR ROUGH WORKING ONLY.

- The hydroxide anion can react with chloroethane via a mechanism that is abbreviated $S_{N} 2$, as shown below. Add curly arrows to the reaction scheme to complete a mechanism for this reaction.

Explain what each part of the abbreviation $\mathrm{S}_{\mathrm{N}} 2$ means.
$S=$
${ }_{N}=$
$2=$
The hydroxide anion undergoes an apparently similar reaction with ethanoyl chloride:

Draw a mechanism (using curly arrows) for this reaction, thereby demonstrating how it is fundamentally different to the reaction of chloroethane above.

In each of these reactions, a full molecular orbital of the hydroxide anion (the HOMO) interacts with an empty molecular orbital of the organic halogen compound (the LUMO).

Which orbital is the LUMO in chloroethane?
Which orbital is the LUMO in ethanoyl chloride?

- A step-by-step mechanism for the formation of an acetal from a hemiacetal is outlined below. Demonstrate your understanding of reaction mechanisms by adding curly arrows to complete this mechanism.
Note: you don't need to have seen this mechanism before to answer this question.

Overall, what type of reaction $(\mathbf{P} \rightarrow \mathbf{Q})$ is shown here?
$\square$
Identify one nucleophile and one electrophile in the scheme above.

| nucleophile | electrophile |
| :--- | :--- |
|  |  |

THE REMAINDER OF THIS PAGE IS FOR ROUGH WORKING ONLY.
