## INSTRUCTIONS TO CANDIDATES

- All questions are to be attempted. There are 19 pages of examinable material.
- Complete the written section of the examination paper in INK.
- Read each question carefully. Report the appropriate answer and show all relevant working in the space provided.
- The total score for this paper is 100 . The possible score per page is shown in the adjacent tables.
- Each new question of the short answer section begins with a $\bullet$.
- Electronic calculators, including programmable calculators, may be used. Students are warned, however, that credit may not be given, even for a correct answer, where there is insufficient evidence of the working required to obtain the solution.
- Numerical values required for any question, standard electrode reduction potentials, a Periodic Table and some useful formulas may be found on the separate data sheet.
- Pages $16,18,22$ \& 24 are for rough working only.

OFFICIAL USE ONLY

- Explain in terms of their electronic configurations and ionisation energies why the alkali metals (Group 1) are powerful reducing agents.
$\qquad$
- The half-life for the first order decomposition of $\mathrm{N}_{2} \mathrm{O}_{5}(\mathrm{~g})$ is $6.00 \times 10^{4} \mathrm{~s}$ at $20^{\circ} \mathrm{C}$. Calculate the rate constant, $k$, at this temperature.

What percentage of the $\mathrm{N}_{2} \mathrm{O}_{5}$ molecules will have reacted after one hour?

- The solubility product constant of $\mathrm{Fe}(\mathrm{OH})_{3}$ is $1 \times 10^{-39} \mathrm{M}^{4}$. What is the concentration of $\mathrm{Fe}^{3+}(\mathrm{aq})$ in equilibrium with $\mathrm{Fe}(\mathrm{OH})_{3}$ at pH 7.0 ?
$\square$
ANSWER:
To what value does the pH need to be increased to decrease the concentration of $\mathrm{Fe}^{3+}(\mathrm{aq})$ to a single $\mathrm{Fe}^{3+}(\mathrm{aq})$ ion per litre of solution?

## ANSWER:

- Complete the following table.

| Formula | Oxidation <br> state of <br> transition <br> metal | Coordination <br> number of <br> transition <br> metal | Number of <br> $d$-electrons <br> in metal in <br> complex ion | Species formed upon <br> dissolving in water |

| $\left[\mathrm{Co}(\mathrm{en})_{3}\right] \mathrm{Br}_{3}$ |  |  |  |  |

en = ethylenediamine $=\mathrm{NH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{NH}_{2}$

- Teeth are made from hydroxyapatite, $\mathrm{Ca}_{5}\left(\mathrm{PO}_{4}\right)_{3} \mathrm{OH}$. Why does an acidic medium promote tooth decay and how can the decay be stopped using fluoridation of drinking water? Use chemical equations where appropriate.
- Solution A consists of a 0.15 M aqueous solution of nitrous acid $\left(\mathrm{HNO}_{2}\right)$ at $25^{\circ} \mathrm{C}$.
$\square$
At $25^{\circ} \mathrm{C}, 1.00 \mathrm{~L}$ of Solution B consists of 13.8 g of sodium nitrite $\left(\mathrm{NaNO}_{2}\right)$ dissolved in water. Calculate the pH of Solution B.

## ANSWER:

Solution B $(1.00 \mathrm{~L})$ is poured into Solution A $(1.00 \mathrm{~L})$ and allowed to equilibrate at $25^{\circ} \mathrm{C}$. Calculate the pH of the final solution.

- Draw the constitutional formula(s) of the major organic product(s) formed in each of the following reactions.

- Compound $\mathbf{X}$ was isolated as a derivative of a natural product.

Carbon 4 of $\mathbf{X}$ is a stereogenic centre. List the substituents attached to $\mathbf{C} 4$ in descending order of priority according to the sequence rules.
highest priority
lowest priority

What is the systematic name for compound $\mathbf{X}$ ? Make sure you include all relevant stereochemical descriptors.
$\square$
Reduction of $\mathbf{X}$ with sodium borohydride $\left(\mathrm{NaBH}_{4}\right)$ followed by quenching the reaction with dilute acid gives $\mathbf{Y}$. Give the constitutional formula for $\mathbf{Y}$.

Product $\mathbf{Y}$ can be separated into two isomers. Explain.

- Compound $\mathbf{Z}$ can readily be identified by ${ }^{1} \mathrm{H}$ NMR spectroscopy.

How many signals would you expect to see in the ${ }^{1} \mathrm{H}$ NMR spectrum of compound $\mathbf{Z}$ ?

Write the letters $\mathbf{a}, \mathbf{b}, \mathbf{c}$, etc on the diagram of compound $\mathbf{Z}$ to identify each unique hydrogen environment giving rise to a signal in the ${ }^{1} \mathrm{H}$ NMR spectrum.

Sketch the ${ }^{1} H$ NMR spectrum for compound $\mathbf{Z}$. Label each signal in the spectrum with $\mathbf{a}, \mathbf{b}, \mathbf{c}$, etc to correspond with your assignments on the diagram of $\mathbf{Z}$ above. Make sure you show the relative number of hydrogens and the splitting pattern (number of fine lines) you would expect to see for each signal.

- Complete the three step mechanism for the reaction given below. Draw intermediate structures, curly arrows and partial charges as appropriate to illustrate the bonding changes that take place.
(
- Draw the repeating unit of the polymer formed in the following reactions.
Cles)
- Show clearly the reagents you would use to carry out the following chemical conversion.

Draw constitutional formulas for any intermediate compounds.
NOTE: More than one step is necessary.
