## INSTRUCTIONS TO CANDIDATES

- All questions are to be attempted. There are 21 pages of examinable material.
- Complete the written section of the examination paper in INK.
- Read each question carefully. Report the appropriate answer and show all relevant working in the space provided.
- The total score for this paper is 100 . The possible score per page is shown in the adjacent tables.
- Each new question of the short answer section begins with a $\bullet$.
- Electronic calculators, including programmable calculators, may be used. Students are warned, however, that credit may not be given, even for a correct answer, where there is insufficient evidence of the working required to obtain the solution.
- Numerical values required for any question, standard electrode reduction potentials, a Periodic Table and some useful formulas may be found on the separate data sheet.
- Pages 17 \& 24 are for rough working only.

OFFICIAL USE ONLY

- 2-Propanol can be oxidised to acetone using $\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}$ in acidic solution as indicated in the reaction below. The rate of decrease of the $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}$ ion under a certain set of conditions is $3.0 \mathrm{~mol} \mathrm{~L}^{-1} \mathrm{~s}^{-1}$.

$$
3 \mathrm{CH}_{3} \mathrm{CH}(\mathrm{OH}) \mathrm{CH}_{3}+\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+8 \mathrm{H}^{+} \rightarrow 3 \mathrm{CH}_{3} \mathrm{COCH}_{3}+2 \mathrm{Cr}^{3+}+7 \mathrm{H}_{2} \mathrm{O}
$$

What is the rate of increase in the concentration of $\mathrm{Cr}^{3+}$ ?

What is the rate of decrease in the concentration of 2-propanol?

The rate law for this reaction is: $\quad$ Rate $=k\left[\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}\right]\left[\mathrm{CH}_{3} \mathrm{CH}(\mathrm{OH}) \mathrm{CH}_{3}\right]\left[\mathrm{H}^{+}\right]^{2}$
Complete the following table by writing increase, decrease or no change in the box to indicate how the rate of the reaction is affected by each of the following changes.

- Complete the following table.

| Formula | Systematic name | Oxidation <br> state of <br> transition <br> metal | Number of <br> $d$-electrons |
| :---: | :---: | :---: | :---: |
| $\mathrm{K}_{2}\left[\mathrm{Pt}(\mathrm{CN})_{4}\right]$ |  |  |  |
| $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right] \mathrm{Cl}_{2}$ |  |  |  |

- Calculate the pH of a solution that is prepared by mixing 500 mL of $1.0 \mathrm{M} \mathrm{NH}_{3}$ with 500 mL of $2.0 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$. The $\mathrm{p} K_{\mathrm{b}}$ of $\mathrm{NH}_{3}$ is 4.76 .
$\square$
In the presence of excess hydroxide ion, $\mathrm{Mg}^{2+}$ can be precipitated as $\mathrm{Mg}(\mathrm{OH})_{2}(\mathrm{~s})$. What amount (in mol) of solid sodium hydroxide must be added to a 0.10 M solution of $\mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}$ to just cause precipitation of $\mathrm{Mg}(\mathrm{OH})_{2}(\mathrm{~s})$. The solubility product constant of $\mathrm{Mg}(\mathrm{OH})_{2}$ is $7.1 \times 10^{-12} \mathrm{M}^{3}$.

## ANSWER:

In a separate experiment, the $\mathrm{Mg}(\mathrm{OH})_{2}$ is precipitated by adding 0.10 mol of $\mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}$ to 1.0 L of a $0.10 \mathrm{M} \mathrm{NH}_{3}$ solution. What amount (in mol) of $\mathrm{NH}_{4} \mathrm{Cl}$ must be added to this solution to just dissolve the precipitate?

- Shown here is the classical form of the amino acid leucine.

List the types of intermolecular interactions in which the sites $\mathbf{A}$ and $\mathbf{B}$ could be involved.

A
B
Leucine has an unusually high melting point for a small molecule. Suggest a reason for this.

- Metal atoms participate in many biological processes. The following table shows a number of metals, one property of each metal and the biological function for which the metal is important. Complete the table.

| Metal | Property which is important for <br> biological activity | Biological function to which this <br> property is relevant |
| :---: | :--- | :--- |
| Cu | Can exist in two oxidation states, <br> +I and +II |  |
|  | Forms square-planar co-ordination <br> compounds | Cancer chemotherapy |
| Fe |  | Oxygen transport in blood |

- Ice is less dense than liquid water. The triple point of water is $0.001^{\circ} \mathrm{C}, 0.006 \mathrm{~atm}$ and its critical point is $374^{\circ} \mathrm{C}$, 218 atm . Sketch the phase diagram for water showing all the main features.
- Draw the structure(s) of the major organic product(s) formed in each of the following reactions. Give the names of the products where requested.
(

THE REMAINDER OF THIS PAGE IS FOR ROUGH WORKING ONLY.

- Compound $\mathbf{X}$ can be reduced by treatment with sodium borohydride followed by dilute hydrochloric acid to form a mixture of diol compounds.

Clearly draw all possible product stereoisomers that can form from this reduction, taking care to represent clearly the stereochemistry of the products.
$\square$
Clearly label each isomer drawn above as either chiral or achiral (not chiral).
Circle one of the product isomers you have drawn above and provide a full systematic name for this compound below. Make sure you include all relevant stereochemical descriptors.

THE REMAINDER OF THIS PAGE IS FOR ROUGH WORKING ONLY.

- Compound $\mathbf{Y}$ can readily be identified by ${ }^{1} \mathrm{H}$ NMR spectroscopy.

On the diagram of $\mathbf{Y}$, write the letters $\mathbf{a}, \mathbf{b}, \mathbf{c}$, etc. as necessary to identify each unique hydrogen environment giving rise to a signal in the ${ }^{1} \mathrm{H}$ NMR spectrum.
$\qquad$

Sketch the ${ }^{1} \mathrm{H}$ NMR spectrum of compound $\mathbf{Y}$. Label each signal in the spectrum with $\mathbf{a}, \mathbf{b}, \mathbf{c}$, etc. to correspond with your assignments on the diagram of $\mathbf{Y}$. Make sure you show the splitting pattern (number of fine lines) you expect to see for each signal. Also write the relative number of hydrogens you expect above each signal.

Compound $\mathbf{Z}$ is an isomer of $\mathbf{Y}$.

What kind of isomers are they?
Compounds $\mathbf{Y}$ and $\mathbf{Z}$ can be readily distinguished by instrumental techniques.
Suggest how three different techniques can be used to distinguish between the two structures.

- Complete the two step mechanism for the reaction given below. Draw intermediate structures, curly arrows and partial charges as appropriate to illustrate the bonding changes that take place.

- Show clearly the reagents you would use to carry out the following chemical conversion. Draw constitutional formulas for any intermediate compounds. NOTE: More than one step is necessary.
