Topics in the June 2014 Exam Paper for CHEM1903

Click on the links for resources on each topic.

2014-J-2:

• Nuclear and Radiation Chemistry

2014-J-3:

• Nuclear and Radiation Chemistry

2014-J-5:

- Wave Theory of Electrons and Resulting Atomic Energy Levels
- Atomic Electronic Spectroscopy
- Ionic Bonding

2014-J-6:

- Lewis Structures
- VSEPR

2014-J-7:

- Lewis Structures
- VSEPR
- Types of Intermolecular Forces

2014-J-8:

- Chemical Equilibrium
- Equilibrium and Thermochemistry in Industrial Processes

2014-J-9:

- Chemical Equilibrium
- Equilibrium and Thermochemistry in Industrial Processes

2014-J-10:

- First and Second Law of Thermodynamics
- Electrochemistry

2014-J-11:

- First and Second Law of Thermodynamics
- Equilibrium and Thermochemistry in Industrial Processes

2014-J-12:

• Electrochemistry

2014-J-13:

• Batteries and Corrosion

2014-J-14:

• Batteries and Corrosion

2221(a)

THE UNIVERSITY OF SYDNEY <u>CHEMISTRY 1A (ADVANCED) - CHEM1901</u> <u>CHEMISTRY 1A (SPECIAL STUDIES PROGRAM) - CHEM1903</u>

CONFIDENTIAL

FIRST SEMESTER EXAMINATION

JUNE 2014

TIME ALLOWED: THREE HOURS

GIVE THE FOLLOWING INFORMATION IN BLOCK LETTERS

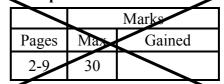

FAMILY NAME	SID NUMBER	
OTHER NAMES	TABLE NUMBER	

INSTRUCTIONS TO CANDIDATES

- All questions are to be attempted. There are 21 pages of examinable material.
- Complete the written section of the examination paper in <u>INK</u>.
- Read each question carefully. Report the appropriate answer and show all relevant working in the space provided.
- The total score for this paper is 100. The possible score per page is shown in the adjacent tables.
- Each new short answer question begins with a •.
- Only non-programmable, Universityapproved calculators may be used.
- Students are warned that credit may not be given, even for a correct answer, where there is insufficient evidence of the working required to obtain the solution.
- Numerical values required for any question, standard electrode reduction potentials, a Periodic Table and some useful formulas may be found on the separate data sheets.
- Pages 18 and 24 are for rough working only.

OFFICIAL USE ONLY

Marks • In March 2011 after a tsunami flooded the Fukushima Daiichi nuclear power plant, 6 three of the six reactors went into meltdown, and by 31 March had released large quantities of the nuclides detailed in the table below. Initial activity of quantity released (10^{15} Bq) Radioisotope Half-life ¹³¹I 511 8.02 days ¹³⁷Cs 13.6 30.17 years Given that the only stable nuclide of iodine is ¹²⁷I, would you expect the primary decay mechanism for ¹³¹I to be α , β^- , or β^+ decay? Briefly explain your reasoning. Calculate the decay constant for ¹³¹I. Answer: Calculate the initial mass of ¹³¹I released. Answer:

THIS QUESTION CONTINUES ON THE NEXT PAGE.

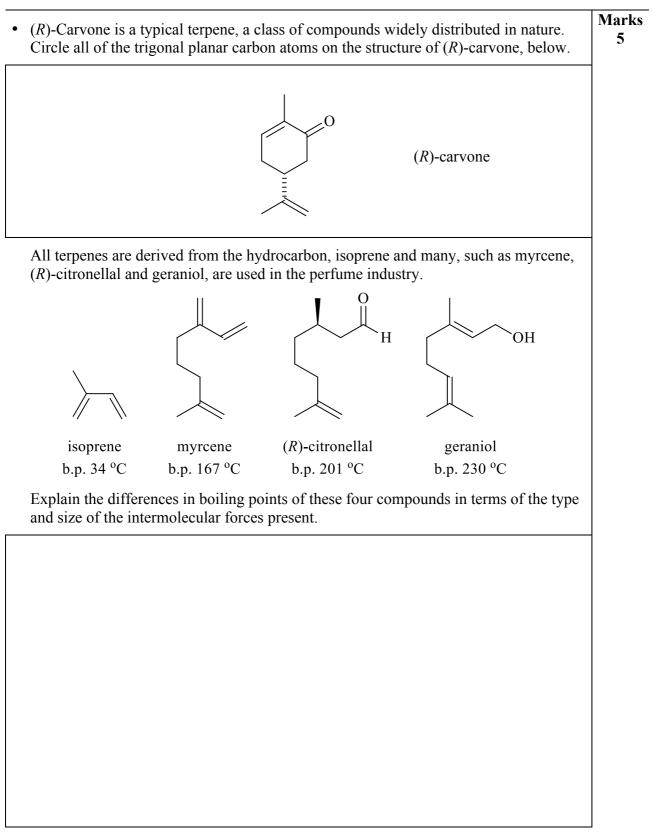

monitor t the expect	the relative activitie cted activity due to	whether further radionuclide leaks are occurring is to es of the different nuclides as a function of time. Calculate each of these nuclides exactly 3 years after the release. quently escaped from the reactors.

Marks • When 10.0 g of solid ammonium carbamate NH₂CO₂NH₄ is placed in an evacuated 5 1.0 L flask at 25 °C, the pressure in the flask rises to 88 mmHg. Write a balanced equation for the decomposition of ammonium carbamate into ammonia gas and carbon dioxide. Calculate the equilibrium constant in terms of partial pressures, K_p , for the decomposition of ammonium carbamate. Answer: This flask is connected by a hose (of negligible volume) to another 1.0 L flask at 25 °C containing 1.00 atm of $H_2S(g)$. A tap between the flasks is opened and the gaseous contents allowed to mix. Given the following reaction data: NH₄SH(s) \implies NH₃(g) + H₂S(g) $K_p = 9.40 \times 10^{-2}$ at 25 °C, calculate K_p for the new equilibrium that is established, *viz*. $NH_2CO_2NH_4(s) + H_2S(g)$ \checkmark NH₃(g) + CO₂(g) + NH₄SH(s) Answer:

THIS QUESTION CONTINUES ON THE NEXT PAGE.

Hence calculate the total pressure in the f	lasks at equilibrium.	Marks 3

A voltaic cell consists of Cd^{2+}/Cd and Ag $[Cd^{2+}] = 1.00 \text{ M}$ and $[Ag^+] = 0.60 \text{ M}$. Ea What is the voltage of the cell at 20 °C after equilibrium has been reached? What are the concentrations of the $Cd^{2+}(a)$ equilibrium has been reached?		Marks 4
[Cd ²⁺] _{eq} =	$[Ag^+]_{eq} =$	

CHEM1901/1903 2014-J-13 Marks • $LiMn_2O_4$ (s) is an infinite network solid with the spinel-type structure, shown below. 3 White circles are Li atoms, black circles are Mn atoms and grey circles are oxygen atoms. Dashed lines represent the unit cell. What are the most important types of chemical bonds responsible for making LiMn₂O₄ a stable solid? LiMn₂O₄ is commonly used as a cathode in rechargeable lithium-ion batteries. The battery is charged by moving Li⁺ ions out of this cathode to give Li_{1-x}Mn₂O₄. Explain how this is possible. The anode is C (graphite), which gives Li_xC_6 on charging. Describe how the lithium is incorporated into the graphite anode.
