

## Worksheet 3 – Answers to Critical Thinking Questions

The worksheets are available in the tutorials and form an integral part of the learning outcomes and experience for this unit.

### Model 1: Two charged Particles Separated by a Distance $r$

1.  $V$  gets smaller in magnitude.
2.  $V \rightarrow 0$  as  $r \rightarrow \infty$ .
3.  $V > 0$ : a repulsive interaction.
4.  $q_{\text{proton}} = +e$
5.  $V < 0$ : an attractive interaction.
6. The potential is negative and decreases in magnitude as  $r$  increases until it reaches zero at ionization.

7.

$$V = k \times \frac{(+2) \times (-1)e^2}{r} + k \times \frac{(+2) \times (-1)e^2}{r} + k \times \frac{(-1) \times (-1)e^2}{2r}$$

electron 1 with  
nucleus

electron 2 with  
nucleus

electron 1 with  
electron 2

$$V = -\frac{7ke^2}{2r}: \text{overall attractive.}$$

### Model 2: Electron Energy

1.

$n$	$E_n$ (J)	$r_{\text{average}}$ (m)
1	$-218 \times 10^{-20}$	$0.529 \times 10^{-10}$
2	$-54.5 \times 10^{-20}$	$2.12 \times 10^{-10}$
3	$-24.2 \times 10^{-20}$	$4.76 \times 10^{-10}$
4	$-13.6 \times 10^{-20}$	$8.46 \times 10^{-10}$
5	$-8.72 \times 10^{-20}$	$13.2 \times 10^{-10}$
6	$-6.06 \times 10^{-20}$	$19.0 \times 10^{-10}$

2. See left hand graph below.
3. The energy of the levels gets smaller in magnitude and they get closer together as  $n$  increases. The average size of the orbit gets rapidly larger as  $n$  increases.
4. The energy of the electron tends to zero and the orbit tends to infinity when  $n$  becomes very large.

### Model 3: Atomic Spectroscopy

- Shown as red lines on the left hand graph below.
- $n = 4 \rightarrow n = 3: \Delta E = -10.6 \times 10^{-20} \text{ J}; E_{\text{photon}} = -\Delta E = +10.6 \times 10^{-20} \text{ J}$  or 0.66 eV  
 $n = 4 \rightarrow n = 2: \Delta E = -40.9 \times 10^{-20} \text{ J}; E_{\text{photon}} = -\Delta E = +40.9 \times 10^{-20} \text{ J}$  or 2.55 eV  
 $n = 4 \rightarrow n = 1: \Delta E = -204 \times 10^{-20} \text{ J}; E_{\text{photon}} = -\Delta E = +204 \times 10^{-20} \text{ J}$  or 12.8 eV
- (a)  $n = 2 \rightarrow n = 5$   
(b)  $n = 3 \rightarrow n = 7$

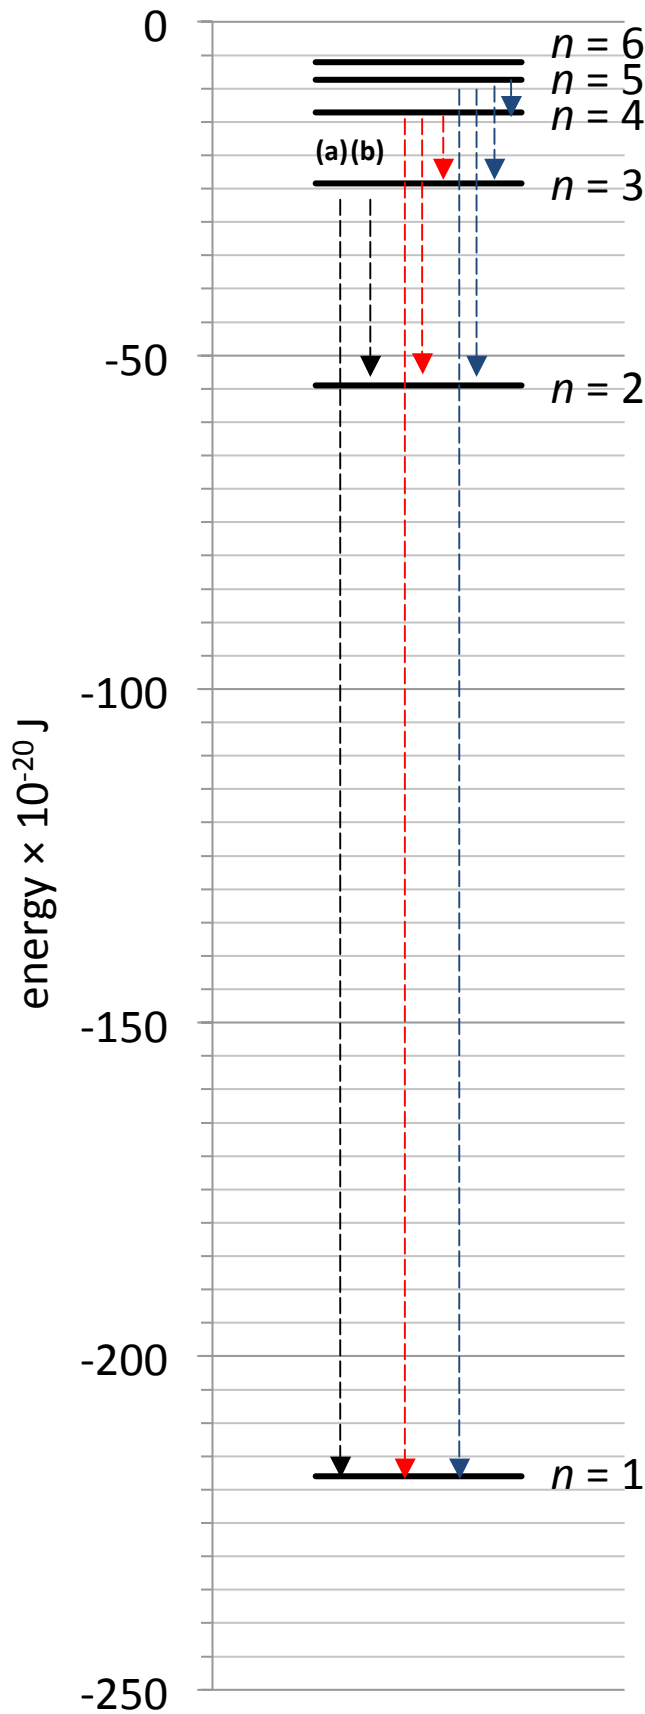

### Workshop: Unit conversions for electromagnetic radiation (photons)

- $E$  is the energy (J),  $h$  is Planck's constant (J s),  $\nu$  is the frequency (Hz or  $\text{s}^{-1}$ ),  $c$  is the speed of light ( $\text{m s}^{-1}$ ) and  $\lambda$  is the wavelength (m).
- (a)  $6.93 \times 10^{16} \text{ Hz}$   
(b)  $1.28 \times 10^{18} \text{ Hz}$   
(c)  $6.56 \times 10^{13} \text{ Hz}$
- (a)  $6.29 \times 10^{-2} \text{ m}$   
(b)  $1.07 \times 10^6 \text{ cm}$   
(c)  $5.0 \times 10^9 \text{ mm}$
- (a)  $7.80 \times 10^{-18} \text{ J photon}^{-1}$  or  $4690 \text{ kJ mol}^{-1}$   
(b)  $1.6855 \times 10^{-23} \text{ J photon}^{-1}$  or  $0.010150 \text{ kJ mol}^{-1}$
- (a)  $\lambda = 1.61 \times 10^{-7} \text{ m}$  and  $\nu = 1.86 \times 10^{15} \text{ Hz}$   
(b)  $\lambda = 5.60 \times 10^{-7} \text{ m}$  and  $\nu = 5.35 \times 10^{14} \text{ Hz}$

### Workshop: Unit conversion for wave-particles with rest mass

- $E$  is the energy (J),  $m$  is the mass (kg),  $v$  is the velocity ( $\text{m s}^{-1}$ ),  $\lambda$  is the wavelength (m) and  $h$  is Planck's constant (J s).
- (a)  $\lambda = 1.45 \times 10^{-9} \text{ m}$   
(b)  $\lambda = 6.38 \times 10^{-9} \text{ m}$   
(c)  $\lambda = 4.41 \times 10^{-6} \text{ m}$
- (a)  $E_{\text{kinetic}} = 1.71 \times 10^{-20} \text{ J}$   
(b)  $E_{\text{kinetic}} = 1.12 \times 10^{-38} \text{ J}$
- $E_{\text{kinetic}} = 2.3 \times 10^{-20} \text{ J}$

### Energy levels of the H atom

### Atomic Spectrum of the H atom

The calculated transition energies are shown on the diagram on the right: this is how the spectrum arises.
